

國立雲林科技大學教育部補助AI應用領域系列課程-電子工程系人工智慧計算晶片設計和應用人才培育

LAB7-Deeplab

國立雲林科技大學

夏世昌 特聘教授 / 電子工程系

王斯弘 助理教授 / 前瞻學位學士學程

2022, Fall Semester

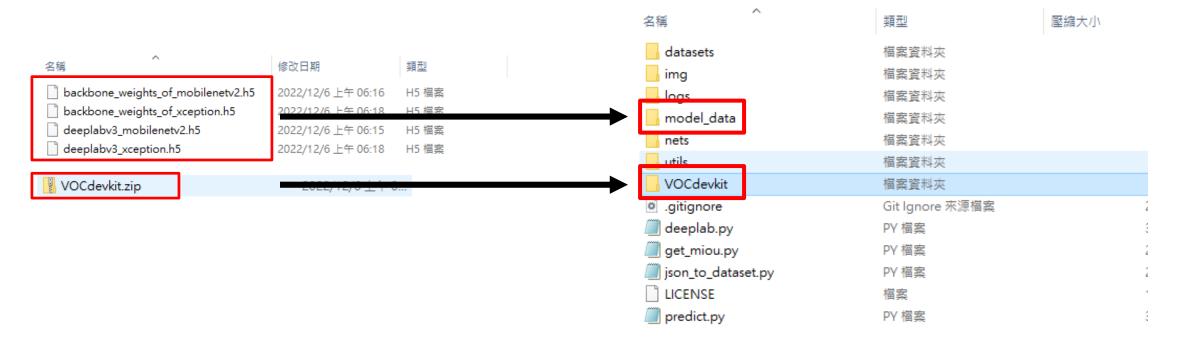

dataset

從雲端下載 .h5檔、dataset和deeplabv3-plus-tf2-main.zip

把.h5檔與dataset放到deeplabv3-plus-tf2-main的指定資料夾

>python voc_annotation.py

文件生成對應的txt

>python train.py

訓練完會生成.h5,在logs資料夾底下

loss_2022_12_06_18_33_07

loss_2022_12_06_20_54_17

best_epoch_weights.h5

ep005-loss0.413-val_loss0.114.h5

修改Deeplab.py的路徑

修改訓練完權重檔路徑

儲存權重檔路徑

```
self.model.save('./export/deeplab.h5')
self.model.summary()
```

預測

>python predict.py

在紅框地方輸入img/street.jpg

```
Total params: 2,758,597
Trainable params: 2,719,813
Non-trainable params: 38,784

Configurations:

| keys | values|
| model_path | logs/best_epoch_weights.h5|
| num_classes | 21|
| backbone | mobilenet|
| input_shape | [512, 512]|
| downsample_factor | 16|
| mix_type | 0|

Input image filename:
```

預測結果

將.h5檔轉成tflite

雲端提供deeplab_tflite.ipynb, 記得修改圖片路徑與.h5檔的路徑

```
IMAGE_SIZE = 512
def representative_data_gen():
    dataset_list=glob.glob('VOCdevkit/VOC2007/JPEGImages/*')
    dataset_list_index=np.random.choice(range(len(dataset_list)),100)
    for i in range(100):
        image = dataset_list[dataset_list_index[i]]
        print(image)
        image = tf.io.read_file(image)
        image = tf.io.decode_jpeg(image,channels=3)
        image = tf.image.resize(image,[IMAGE_SIZE, IMAGE_SIZE])
        image = tf.cast(image,tf.float32)
        image = tf.expand_dims(image,0)
        #with tf.Session() as sess:
        # image = sess.run(image)
        yield [image]
```

```
if tf.__version__[0]=='2':
    converter = tf.lite.TFLiteConverter.from_keras_model(save_keras_model)
elif tf.__version__[0]=='1':
    converter = tf.lite.TFLiteConverter.from_keras_model_fi
converter.optimizations = [tf.lite.Optimize.DEFAULT]
converter.target_spec.supported_ops = [tf. lite.OpsSet.TFLITE_BUILTINS_INT8]
converter.inference_input_type = tf.uint8
converter.inference_output_type = tf.uint8
converter.representative_dataset = representative_data_gen
tflite_model = converter.convert()
```

在ubuntu轉edgetpu.tflite檔

雲端有提供訓練完的tflite檔

```
(base) hongyu@ubuntu:~/Downloads$ edgetpu_compiler deeplab.tflite
Edge TPU Compiler version 16.0.384591198
Started a compilation timeout timer of 180 seconds.

Model compiled successfully in 2107 ms.

Input model: deeplab.tflite
Input size: 743.07KiB
Output model: deeplab_edgetpu.tflite
Output size: 1.06MiB
On-chip memory used for caching model parameters: 805.00KiB
On-chip memory remaining for caching model parameters: 6.17MiB
Off-chip memory used for streaming uncached model parameters: 0.00B
Number of Edge TPU subgraphs: 1
Total number of operations: 72
Operation log: deeplab_edgetpu.log
```

在樹梅派上執行

雲端有提供semantic_segmentation.py

將以下兩個檔案放置版端

- 1.自己的edgetpu.tflite
- 2.semantic_segmentation.py

接上鏡頭

B-ground Aero plane Bicycle Bird Boat Bottle Bus
Car Cat Chair Cow Dining-Table Dog Horse
Motorbike Person Potted-Plant Sheep Sofa Train TV/Monitor

樹梅派執行

>python3 semantic_segmentation.py --model 自己的edgetpu.tflite
